Description: Jock-Foot-Fantasy-Licking-Evans-Sexy-Smelly-Feet-lyfnant.Jun 11, 2017 . Here is the BEST torrent program for Windows 7, Windows Vista, Windows XP, Windows 8 and 10! 1.9 Download Size: 113.5 MB Latest version: 1.9.4.4.7 Free to try. Final .Q: Confusing with interpolation Let  $z$  be the complex variable. I

know that  $\frac{1-z}{1-z^\alpha}$  is a fraction of  $\frac{1}{1-z}$  as long as  $z$  is not a pole or a zero. I am reading a book in which the author interpolates between the two as,  $z^\alpha - (1-z)^\alpha = \alpha \left( z^{\alpha-1} - 1 \right) \text{if } \alpha \text{ eq } 0$  I am not getting what is the actual interpolation in this form? It is like as if we have  $\alpha = 0$  so we should have  $(1-z)^0 - z^0 = 0$ , but this is not zero. How can this be interpolated to get zero? Thank You A: There are two distinct "interpolations" here:  $(1-z)^\alpha - z^\alpha = \alpha \left( (1-z)^{\alpha-1} - 1 \right)$  and  $(1-z)^\alpha + z^\alpha = \alpha \left( (1-z)^{\alpha-1} + z^{\alpha-1} \right)$  Note that the first equation is exactly the first part of what you wrote, the second equation is the second part. The first interpolation does not have  $\alpha=0$  in it;  $\alpha$  appears as a factor of the interpolating polynomial (with exponent  $\alpha-1$ ) rather than in the factor  $(1-z)$
