**Smb Resource Scanner Crack With Registration Code Free**

===== Smb Resource Scanner is an easy-to-use application that will help you find open SMB shared resources. It checks computers only with open NBT ports, that allows you quickly scan large IP-ranges. Your IP scanner can now detect shared resources (SMB, FTP, HTTP, MySql, Oracle) on a network. With our new NBT engine, you can check quickly if a PC is open to a certain resource. We have added support for all standard SMB, FTP, HTTP, MySql, Oracle, Samba servers. Visit our website: Smb Resource Scanner Requirements:

===== This application needs the following modules: \* libnet.dll \* netapi32.dll \* samba.dll \* smb.dll \* spoolss.dll \* snmp.dll \* wininet.dll \* libieee.dll Detection method can be: \* SNMP \* NBT \* Banner Grab Currently only SNMP support is provided. How to detect if a SMB Server is open:

===== NBT stands for Network-Based Traffic. It is used to detect open resources on a network. Simply put, NBT is a traffic analysis protocol that will help you detect open ports on a computer network. The NBT Engine is a software development kit that is able to analyze and detect network traffic. It was written

---

by myself. There is no other way to check computers for open ports that do not use NBT. How to get NBT support:  
===== In order to use the NBT Engine, you need to download and install the latest source code from the Downloads section. You can compile the code yourself or simply download a precompiled version from our website. You can use a Windows 2000+ SDK to compile the source code. You can use a Windows 2003+ SDK to compile the source code. If you use a different SDK, you have to download and install the latest SDK from the Downloads section. When you compile the code you have to link with the following library's: libnet.dll libnetapi.dll samba.dll netapi32.dll spoolss.dll snmp.

**Smb Resource Scanner Crack+**

===== This software will help you in the network scanning process. The software will periodically perform a MAC-Address -to- Port mapping scan to detect open SMB shared resources. This tool is easy to use and easy to understand. Features: ===== - Scanning for more than one port simultaneously. - Scanning in intervals. - User-friendly interface. - Easy to use. - Super easy to use. Contact the author via the Q&A forum: System Requirements:  
===== - Windows XP, Windows Vista,

---

Windows 7, Windows 8. - 2.0 GHz Intel Celeron/Pentium 4/AMD Athlon Processor. - 50 MB of RAM. - 1 GB hard drive space. - 50 MB available on the hard drive.

Installation: ===== - You can download a free trial of this software. - You can freely explore the features of the software. - The free version of this software can be distributed without any limitation. - The free version of this software can be used for 30 days without registration. Legal

Notice: ===== - All copyrights, trademarks and proprietary rights are reserved by their respective owners.

What's new in this version:

===== - Search for NBT resources for remote IP addresses. - Added the possibility to perform scans with other IP ranges simultaneously. - Fixed a bug when scanning for NBT resources. - Fixed a bug when scanning with a port different from 21. - Fixed a bug when changing the port of the scan. - Improved the password protection of Windows shares. - Improved the MAC - Port pairing algorithm. - Added the possibility to disable Windows default access rights on Windows servers. - Fixed a bug when scanning with a port different from 21. - Fixed a bug when saving scanned information. - Fixed a bug when searching for resources. - Fixed a bug when saving scanned information. - Improved scanning speed. - Improved user-friendliness. - Improved the password protection of

---

Windows shares. - Improved the MAC - Port pairing algorithm. - Improved the Scan history. - Improved scanning speed. - Fixed a bug when searching for resources. - Fixed a bug when saving scanned information. - Improved the password protection of Windows shares. - Improved the MAC - Port pairing 77a5ca646e

----- SmbResource Scanner is a simple program to check for open SMB shared resources. It checks computers only with open NBT ports, that allows you quickly scan large IP-ranges. It can check groups of computers. It allows you to scan one or more computers at once, so you can take a look at the resources of all of them. It keeps a log of what it found. It has an overview of all discovered open shares. You can specify what type of resource you want to scan for (netbios, printer, CIFS, etc). This means that if you want to scan for printer shares, you need to add "print" to the list of resource types. It also has some basic filters, such as ports and other filters. It will keep an overview of what resources it finds (shares, printer, NFS, IP-Address, etc). Features:

----- \* Checks computers only with open NBT ports, that allows you quickly scan large IP-ranges. \* Checks computers with network names and IP-addresses, so you can scan even computers without internet access. \* Quick scan of 100-1000 computers at once \* Log of what it found \* Detailed overview of all discovered open shares \* Basic filters \* Scan multiple computers (can check all computers at once) \* Group-Scan (can check computers in a group) \* Port filters, such as 80, 139, 445 \* IP filtering: IPv4, IPv6 \*

---

Specify what type of resources to scan for (netbios, printer, CIFS, etc) \* Specify what type of resource you want to scan for (printer, printer2, netbios, etc) \* Scan a specific computer, IP-address or computer groups \* Scan multiple IP-addresses (can check both LANs) \* Scan a range of IP-addresses (can check both LANs) \* Scan a range of IP-addresses (can check both LANs) \* Scan a range of IP-addresses (can check both LANs) \* Scan a range of IP-addresses (can check both LANs) \* Scan a range of IP-addresses (can check both LANs) \* List of IP-addresses that contain "SMB" or "SMB2" protocols \* List of IP-addresses that contain "SMB" or "SMB2" protocols \* List of IP-addresses that contain "

#### What's New In Smb Resource Scanner?

Smb Resource Scanner is an easy-to-use application that will help you find open SMB shared resources. It checks computers only with open NBT ports, that allows you quickly scan large IP-ranges. It takes advantage of Windows Server 2008+ Active Directory and DNS to find open SMB ports and share names. It supports both Windows and Linux hosts. The software is made with users in mind. So it does not display the list of discovered resource names and passwords. It only displays open ports, which let you know whether the discovered resources are safe or not. The list of

---

discovered resource names and passwords is stored locally and never sent over the network. It does not communicate with any other devices and helps prevent the risk of being monitored by network administrators. The user interface is designed for usability. It has a clean layout. The main window has the left pane listing discovered resources and the right one showing the discovered port numbers. You can scan only some IP ranges, check Windows and Linux hosts, use a proxy, as well as filter host list by name, IP or URL. It supports Windows and Linux hosts. It takes advantage of Windows Server 2008+ Active Directory and DNS to find open SMB ports and share names. You can choose the port range to be scanned (25, 139, 445, 139 or 445) and determine whether to scan only open SMB resources or not. You can also choose whether to list discovered names and passwords or not. The software is made with users in mind. So it does not display the list of discovered resource names and passwords. It only displays open ports, which let you know whether the discovered resources are safe or not. The list of discovered resource names and passwords is stored locally and never sent over the network. It does not communicate with any other devices and helps prevent the risk of being monitored by network administrators. - Support both local and remote resource scans.- Ability to scan both windows and Linux hosts.- You can specify the

---

number of hosts you want to scan.- Ability to specify an IP range to be scanned.- Choose between local or remote resource scans.- Specify a proxy server.- Use a proxy server.- Specify whether to list discovered names and passwords or not.- Filter host list by name, IP or URL.- Showing only Open ports, which let you know whether the discovered resources are safe or not.- Ability to delete resource names and passwords that are not safe after resource scan.- Displays a list of discovered resource names and passwords.- Ability to specify whether to save discovered resource names and passwords locally or not.- File location to save discovered resource names and passwords.- Automatic "Log on" options, if the selected resource requires access to NT-based authentication for resource access.- Support password change on the selected resource for all users, if the "Auto-log on" option was enabled.- Support for online resource scans

---

**System Requirements:**

OS: Mac OS X 10.8.5 or higher Processor: 3.4 GHz Intel Core i5 or faster Memory: 8 GB RAM Graphics: NVIDIA GeForce 8600M GT or better, AMD Radeon HD 5670 or better, or Intel HD 4000 integrated graphics Hard Disk: 750 MB free hard disk space Additional Notes: DX10.0c compatible with Mac OS X For the full version of this software click [here](#) There have been major advances in the availability and abilities of the
