Watch full Toilet: Ek Prem Katha 2017 in HD video MP4, 3GP, AVI, MP3Q: Low/unstable ground/electrical current I have a question about a term used in a reference: low/unstable ground/electrical current Some of the papers I have read on the subject define low/unstable as being when there is a rapid change of direction of the voltage across two points relative to each other. Others define it as being when the amplitude of the square wave voltage is low. In either case, the direction of the voltage of current through the load is changing. I wanted to know if there is a term that covers both situations where the voltage is changing rapidly and at a low amplitude. I am asking because I have a design which switches a load on and off by applying a shorted inductor when the input (supply) voltage is low. So I am looking for a term that would allow me to describe the current that flows into the load when the input voltage is low (falling). Edit: I should mention the terms "rise/fall" and "low/high" only apply when the supply voltage is positive/negative, respectively. The input always has a constant magnitude (e.g. it will always drop to zero when the supply is connected to the load and then rise to the supply voltage when disconnected). The term should be applicable when the supply is in a non-linear regime (where it is not a constant magnitude). A: This is a common situation in electronics, not just with transformers, but also with switching power supplies, as the output from the converter must often be (nonlinearly) smoothed to produce a DC voltage. While I'm not entirely sure if this is what you're asking about, to describe the situation where the input voltage varies but the output (apparent) voltage is the same for an inductor that is driven in a non-linear fashion, there are two different names that are used. The most generic name for this is load switching. It is true that in your situation, the load would be switched on and off and there would be an apparent load voltage that is somewhat predictable. However, this load switching does not have the same mathematical constraints as the nonlinear load switching that you are using. For example, we have inrush current concerns when load switching, whereas with nonlinear load switching we can use the fact
